Well first, I tried to create the HomeScreen.js

First problem was, I couldn't figure out how to make an API call With "Base_URL" and "API_KEY". I couldn't figure out how to
to do that wor the first two week.I watched numerous amout of youtube videos and everytime I try one those, I kept getting an
error message that said "Possible unhandled promise rejection". And finally I got it to work

Then I tried creating the all the GenreCards and created the funtion that when it pressed, the color changes like in the
Resturant app that we did in class. But I couldn't make the function that when pressed, it opens another page and show movies
related to that genre.

After that, tried creating the search button and tried to get the movie that I search from the API. Didn't work that too.
I have comments the codes that I tried in HomeScreen.js .

Then tried creating MainNavigation and DrawerNavigation. Got into a whole anoher problem with "nested navigator" and when upon
clicking a movie it doesn't go to the MovieScreen1.js .

Also tried the TabNavigation, couldn't try get it to work.

I tried styling at the last moment and when doing so, when I save everything and tried clicking a movie, it goes to the movie page,
but the image is the same image from a random movie.I think that promblem is because the app renders everytime I do a change and save.

I couldn't create the favorite page that saves movies.Don't understand how to do that.
